

# Control software for the COMbo Ethernet Tester and its integration into the Netopeer configuration system

## Master's thesis

Tomáš Čejka

CTU - Faculty of Information Technology

14. 05. 2012

# Outline of Presentation

- 1 About the COMET Project
- 2 COMET Architecture
- 3 COMET Software Architecture
- 4 Testing
- 5 Installation
- 6 Screenshots
- 7 Conclusion

# About the COMET Project

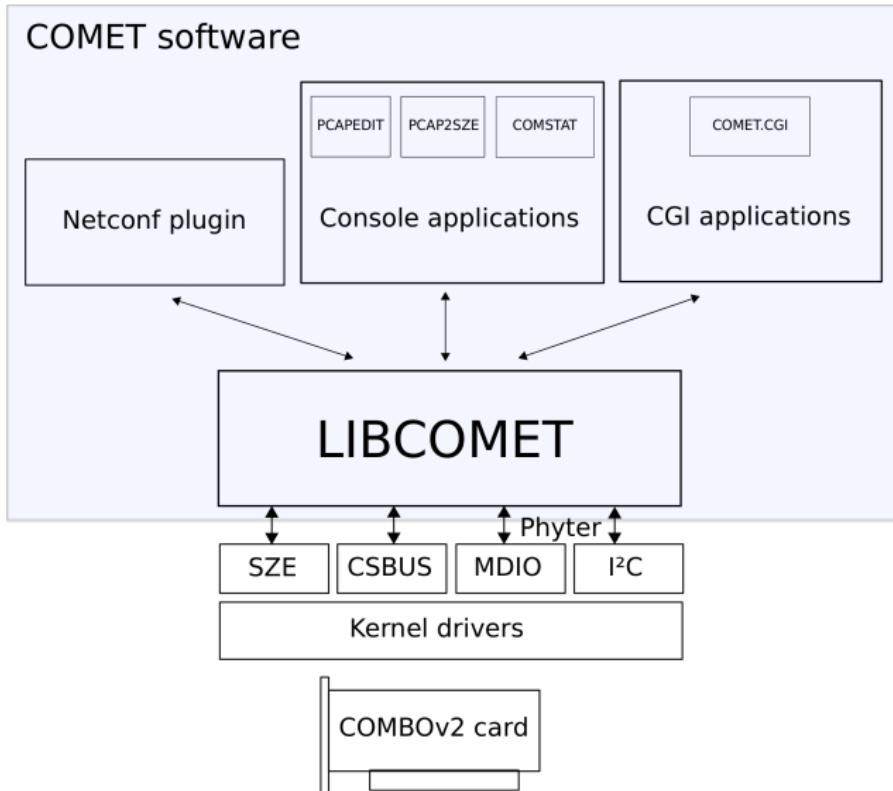

- COMET = COMbo Ethernet Tester
- Idea came from CESNET, z.s.p.o.
- My supervisor – RNDr. Radek Krejčí

What COMET is?

- Ethernet tester built on “Programmable hardware” – COMBOv2 card

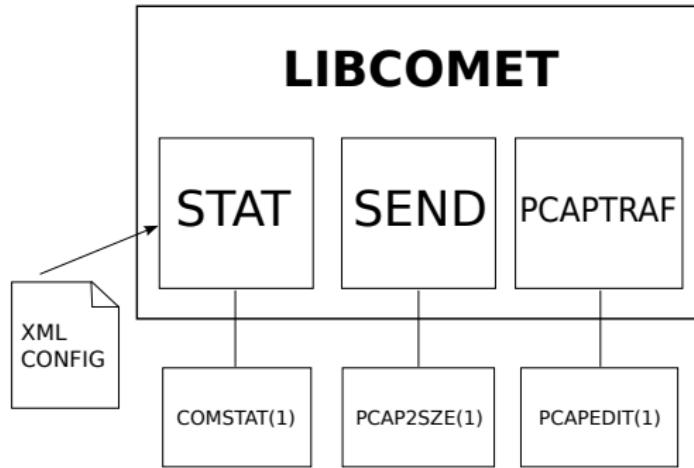

# COMET Architecture

My part was the COMET software design and implementation.

# Software Architecture

Software part uses the *libcomet* library.

**STAT** reading information about device state and incoming traffic,

**SEND** sending stored traffic at given speed,

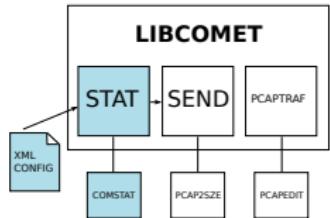

**PCAPTRAF** manipulation with PCAP files.

# STAT Module

Used in *comstat(1)* console application.

This module:

- is based on XML configuration file,
- reads information from hardware,
- writes data into hardware,
- computes values according to simple equations,
- presents values to user.

# SEND Module

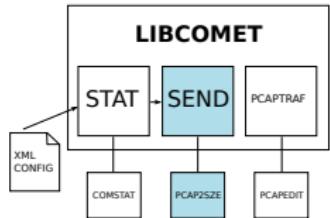

Used in `pcap2sze(1)` console application.

This module:

- is used for sending stored network traffic,
- has many options for timestamp specification,
- allows to repeat packets.

Basic modes of transmission:

- ① full-speed,
- ② user-speed,
- ③ interval-based.

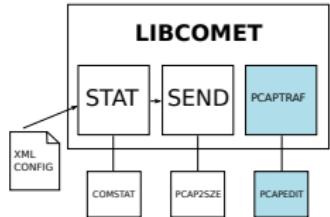

# PCAPTRAF Module

Used in *pcapedit(1)* console application.

This module is used for manipulation with a content of PCAP file.

Some operations:

- load/save PCAP file,
- make a copy of frame,
- remove a frame,
- ...

# NETCONF Support

Done by Netopeer plug-in implementation.

NETCONF — network configuration protocol (RFC6241)

Netopeer — implementation of NETCONF protocol

YANG — configuration modeling language (RFC6020)

For COMET:

- Created data configuration model in YANG;
- COMET has new RPC operations  
(send-traffic, reset-counter, reset-modules);
- Implementation of Netopeer plug-in.

# Testing and Verification

- ① Tests of software part:
  - ▶ static program analysis – Stasne,
  - ▶ dynamic program analysis – Valgrind.
- ② Tests of Netopeer plug-in;
- ③ Tests of the whole COMET device
  - ▶ tested with the Spirent Ethernet tester  
(verified sent and received data).

# Installation of the COMET Software

The COMET software is packed in the *libcomet* and *comet* RPM packages.

Makes installation and boot of COMET easy:

```
[root@localhost] # yum install libcomet comet  
[root@localhost] # comet-boot.sh start
```

# Screenshots of GUI

Statistics module	
Total packet count (received + discarded)	5019
Received frames (not discarded)	5019
Discarded frames	0
Buffer overflow	0
CRC error	0
Bad MAC address	0
Packets over MTU counter	0
Packets below MTU counter	0
MIN packet size	64
MAX packet size	98
MIN packet delay (B)	10
MAX packet delay (B)	141467531342
Number of packets in sum of sizes	5019
Sum of sizes	453866
Read to read delay (clocks)	860165969
Average packet size	90
Histogram of sizes	
0 - 63	0
64 - 127	5019
128 - 191	0

# Conclusion

The work I have done:

- COMET software architecture design,
- designed configuration file structure,
- COMET library implemented,
- console application and GUI implemented,
- NETCONF support,
- RPM packages,
- static and dynamic source codes analysis.
